

TEMPO ENTERPRISE

ADVANTAGES

- Integrating into a single supplier the installation, management and maintenance of your business.
- Increasing the profitability of your business by eliminating the infrastructure and maintenance costs that normally accompany this system:
 - Physical and logical security of the system.
 - Administration and management of the operating system and applications.
 - Communications network infrastructure.
 - Storage, security and integrity of the information generated by the system (Data Centre).
 - Licences and automatic updates of the hosted software (new versions or additions).
- Greater efficiency for your pay and display operation, since you can focus your human and material resources exclusively on your business objectives.
- Reduction in management costs, thanks to the remote and centralised control of all your pay and display operations, regardless of their geographical location and time zone.
- Exclusive web features of the Tempo Enterprise management software:
 - Direct and secure access from any location with an Internet connection.
 - Administration of users with different roles and access levels.
 - Intuitive and interactive user interface.
 - System for locating pay and display machines on scrollable geographic maps.
 - Parallel management for different countries and time zones.
 - Non-differentiated management of active and non-active terminals, without losing configurations or historical data.

TEMPO ENTERPRISE

SYNCHRONISATION MODULE

Management of the map showing pay and display machines in your operation and sending different information packages to them (programs, configurations, lists, etc.), with the following features:

- Auditing of the synchronisation status of the entire operation.
- One-off sending of information.
- Planning for the automatic sending of information.
- Monitoring of planned information deliveries (query, verification, elimination).

ALARM MODULE

Real time monitoring and management of the alarms detected by the pay & display machines which are sent to the remote pay and display server, as well as checks of the physical operating parameters (battery, temperature, battery voltage).

STATISTICS MODULE

Allows an audit of the different data generated by the operation to be represented in graph form, by geographic zone, city, physical zone or a specific pay and display machine.

ADMINISTRATION MODULE

Allows for the definition of the internal characteristics and variables for the working environment of your pay and display operations which, depending on their nature, are divided into the following action areas:

- **User administration**
Registering and control of the system users, either at the system software access level (users, roles) or in terms of the access to the hardware for the terminals (operators).
- **Configuration of organisational zones or levels**
- **Importing files**
Spatial definition, organisation and management of your operations into geographic zones, cities, physical zones, configuration zones and pay and display machines for each operation.

VALIDATION MODULE

Manage centralised online operations that allow access to services previously only available to large-scale operations. As everything is integrated, all you have to do is think of the operation you wish to perform, configure it and then test it.

- **Electronic fine cancellation**

Save costs and increase productivity by allowing the user to pay a reduced parking fine at the meter, thus reducing processing costs.

- **Online wallet**

No need to worry any longer about the possibility of fraud with pre-paid cards. The wallet is managed over the server, and the card does not contain any indicator of its balance. The main advantage is that the card does not put money into the system – it is only possible to use existing credit. The wallet can be shared among several cards, and a family wallet can be created.

- **Validation of codes/licence plates**

Configure complex operations for residents, forced rotation and free tickets. Apply different policies depending on the tariff or area according to the time spent, the amount paid or the number of tickets for different periods of time.

COMMUNICATIONS SERVICE

Parkare can manage M2M communications for you. This service guarantees that the configuration of the data service, is correct for operation with our terminals, offering you service of a superior quality, at a very competitive price.

With this service, equipment is connected via a VPN bridge with the operator, thus guaranteeing total privacy of the data transmitted.
